

LAPORAN PRAKTIKUM MOBILE MODUL 1

Nama : El Zidane Ardyansyah

Kelas : XI RPL 7

BUKTI SCREENSHOT

1. Internet Permission

```
1 <manifest xmlns:android="http://schemas.android.com/apk/res/android">
2
3 <uses-permission android:name="android.permission.INTERNET" />
4
5 <application
6   android:label="mobileapp2"
7   android:name="${applicationName}"
8   android:icon="@mipmap/ic_launcher">
9   <activity
10    android:name=".MainActivity"
11    android:exported="true"
12    android:launchMode="singleTop"
13    android:taskAffinity=""
14    android:theme="@style/LaunchTheme"
15    android:configChanges="orientation|keyboardHidden|keyboard|screenSize|smallestScreenSize|locale|layoutDirection|fontScale|screenLayout|density|uiMode"
16    android:hardwareAccelerated="true"
17    android:windowSoftInputMode="adjustResize">
18    <!-- Specifies an Android theme to apply to this Activity as soon as
19         the Android process has started. This theme is visible to the user
20         while the Flutter UI initializes. After that, this theme continues
21         to determine the Window background behind the Flutter UI. -->
22    <meta-data
23      android:name="io.flutter.embedding.android.NormalTheme"
24      android:resource="@style/NormalTheme"
25    />
26    <intent-filter>
27      <action android:name="android.intent.action.MAIN" />
28      <category android:name="android.intent.category.LAUNCHER" />
29    </intent-filter>
30  </activity>
```

2. Konfigurasi URL & Model Data

```
1 final String baseUrl = 'https://learn.smktelkom-mlg.sch.id';
2 final String apiUrl = '$baseUrl/api';
```

```
1 class ResponseDataMap {
2   bool status;
3   String message;
4   Map? data;
5   ResponseDataMap({
6     required this.status,
7     required this.message,
8     this.data,
9   });
10 }
```

```
1 class ResponseDataList {
2   bool status;
3   String message;
4   List? data;
5   ResponseDataList({
6     required this.status,
7     required this.message,
8     this.data,
9   });
10 }
```

3. Logika

```
1 import 'package:http/http.dart' as http;
2 import 'package:mobileapp2/models/response_data_map.dart';
3 import 'dart:convert';
4 import 'package:mobileapp2/services/url.dart' as url;
5
6 class UserService {
7   Future registerUser(data) async {
8     var uri = Uri.parse(url.BaseUrl + '/api/auth/register');
9     var register = await http.post(uri, body: data);
10
11     if (register.statusCode == 200) {
12       var data = json.decode(register.body);
13       if (data['status'] == true) {
14         ResponseDataMap response = ResponseDataMap(
15           status: true,
16           message: 'Sukses Menambah User',
17           data: data['data'],
18         );
19         return response;
20       } else {
21         ResponseDataMap response = ResponseDataMap(
22           status: false,
23           message:
24             "gagal menambah user dengan code error ${register.statusCode}",
25         );
26         return response;
27       }
28     } else {
29       ResponseDataMap response = ResponseDataMap(
30         status: false,
31         message: "HTTP error: ${register.statusCode}",
32       );
33       return response;
34     }
35   }
36 }
37
```

4. ScreenShot tampilan alert

The screenshot displays a mobile application interface. At the top, a green success alert box with a checkmark icon and a close button (X) contains the text "Success" and "Sukses Menambah User". Below the alert is a blue circular button with a white user icon and a plus sign. The main heading is "Buat Akun Baru" (Create New Account), followed by the subtext "Daftar sekarang untuk mengelola toko Anda dengan mudah" (Register now to manage your store easily). The registration form consists of four input fields: "Nama Lengkap" (Full Name) with a person icon, "Email" with an envelope icon, "Pilih Peran" (Choose your role) with a dropdown arrow and the text "Choose your role", and "Password" with a lock icon and a toggle eye icon. At the bottom is a blue button labeled "CREATE ACCOUNT →".

5. A. Fungsi TextEditingController Di setiap text form field adalah **kelas yang digunakan untuk mengontrol dan berinteraksi dengan widget textfield**

B. Mengapa kita perlu memvalidasi input seperti if(value is empty) sebelum mengirim data ke api yaitu **Untuk mengecek di dalam textFormField sudah ada data apa belum jika belum akan mengirimkan sebuah text atau pesan**
